# Data Science Solutions to Integrating Temporally and Spatially Space Data

Vicki Ferrini, Dawn Wright, Jessica Block, Alice Winter, Vid Petrovic, and Stuart Sandin,

New technologies and data visualizations can enhance efforts to better engage the public about ocean science and exploration by capturing people's attention and immersing them in the data; helping people visualize, and thus, better understand the complexity, importance, and depth of ocean exploration and reaching wider, more diverse audiences.

Visualization can help accelerate and advance new scientific discoveries by encouraging work across disciplines, challenging the traditional hypothesis-driven workflow of science, allowing extraction of relevant data in more intuitive ways, and promoting onshore research of offshore data.

### Provoke Thought – Spark Creativity – Encourage Dialogue

## Tackling 'Ocean Exploration in a Sea of Data' at the National Ocean Exploration Forum

Ocean explorers from around the world gathered at the UC San Diego Qualcomm Institute last month for a National Ocean Exploration Forum (NOEF) to discuss a challenging problem: how to make sense of the vast quantities of oceanographic data generated by both historic and contemporary studies of the sea.

This fifth annual forum attracted nearly 125 participants, including scholars of data science, ocean exploration and other disciplines who are interested in how data science analysis and visualization techniques can be applied to oceanographic data. The theme of this year's Forum, "Ocean Exploration in a Sea of Data," was intended to elicit forward-looking recommendations for how data scientists and ocean explorers can smoothly collaborate to expand traditional concepts of ocean exploration while driving new discoveries, providing greater access to data and engaging more effectively with the public.

## MATCHPOINT

Are you looking for a data scientist to work with you on your data?

Are you a data scientist looking for interesting projects?

If so, you have come to the right place. MATCHPOINT is a matching service provided by the Data Science Hub at SDSC. Its goal is to match Domain experts and students with Methods experts and students to create interdisciplinary working teams that can take on challenging problems in data science and analytics. Learn more about [how MATCHPOINT works](#).

Below you'll find a list of MATCHPOINT past, current and future projects. If you are a data scientist, you can find leads to interesting projects here. If you are a PI with a data science problem, create an entry so that people can find you. To see full project details and expert contact information, and to submit new projects or student applications, you will need to [create an account](#) on this site and [login](#).

## 2017 Planning Workshop

### Coral Reef Survey Initiative

On October 30th and 31st, 2017 Schmidt Ocean Institute convened collaborating experts from the global community of ocean researchers and technology developers to help inform about some of the current coral reef research for possible new program and technology development areas. This report provides a summary of recommendations obtained to inform the evaluation and preliminary planning of a coral reef conservation and research initiative. The outcomes will also help identify possible directions and opportunities for our 202 call for proposals.

# AGU FALL MEETING

New Orleans

11-15 Dec. 2017 What will *you* discover?

Hey Vid,

Talks and post-talks meetings went very well. I have some NASA Rover guys interested in your methods of visualization as they have 10 years of data quite like mine that they are looking for easy ways to access and search through. Lots of discussions about machine learning as well.

Cheers  
Nick
